## Project: Chocolate Chip Cookie

## Proposal:

Most people like Chocolate Chip Cookies, some like them soft and others like them crispy. The difference between soft and crispy is the thickness, height, and density of the cookie. This experiment will go through and measure the effectiveness that different combinations of the ingredients have on Chocolate Chip Cookies. The objective is to find the cookie resulting in the best taste and appearance.

The objective of the experiment is to identify and analyze the effects of 4 different ingredients, cooking temperatures, and cooking time. The experiment will be a KVC Model, mixture model.

## Pre-experimental Planning:

## Recognition of and statement of problem

The goal is to achieve the best chocolate chip cookie in taste and appearance.

## Selection of the response variables

| Response Variable | Measurement and <br> accuracy | Measurement Tool |
| :--- | :--- | :--- |
| Length | 1.0 cm | Tape measure |
| Height | 1.0 cm | Tape measure |
| Density | $0.1 \mathrm{~g} / \mathrm{ml}$ | Measuring cup |
| Mass | 0.1 grams | Kitchen scale |
| Taste | $1-9$ scale | Survey |
| Appearance | $1-5$ scale | Survey |
| Softness | $1-5$ scale | Survey |
| Penny Test | $0-40$ | pennies |

Table 1: Response Variables

## Choice of factors, levels, and ranges

## Factors held constant

In the table below are the cooking ingredients that were held constant in the experiment.

| Ingredients | Recipe <br> Amount | Grams for <br> Recipe Amount | Batch size for 4 <br> cookies |
| :--- | ---: | :--- | :--- |
| Flour | $21 / 4 \mathrm{cups}$ | 315 | 35 |
| Baking Soda | 1 tsp | 6 | 0.7 |
| Eggs | 2 | 114 | 13 |
| Chocolate Chips | 2 cups | 324 | 36 |

Table 2: Constant Factors

## Allowed-to-vary Factors and their ranges

| Factor | Recipe <br> Amount | Grams | Low | Center for batch <br> of 4 cookies | High |
| :--- | ---: | ---: | ---: | ---: | ---: |
| Butter | 1 cup | 229 | 17 | 25 | 33 |
| Granulated <br> Sugar | $3 / 4$ cups | 165 | 13 | 18 | 24 |
| Brown sugar | $3 / 4$ cups | 180 | 14 | 20 | 26 |
| Vanilla | 1 tsp | 4 | 0 | .5 | 1 |
| Temperature <br> (F Degrees) | 375 |  | 325 | 350 | 375 |
| Time (mins) | $9-11$ |  | 12 | 15 | 18 |

Table 3: Chosen Factor Levels

## Choice of Experimental Design

There are many different design experiments that could be used. Originally considered a full factorial but due to the time and number runs needed was not feasible with time limitations of the class.

A mixture design experiment was considered for this where the ingredients are not independent. Each of the components together equal 1: $x_{1}+x_{2}+\ldots+x_{p}=1$. In this experiment it would be butter (25) + granulated sugar (18) + brown sugar (20) + vanilla (1) $=64.0$. A pure blend mixture design considers the mixture at $100 \%$ of one of the ingredients, this is not feasible when you are making cookies.

For this experiment a KCV Design with a subtype split-plot was used. It obeys the mixture constants in a mixture model, but also allows process variables. By using a KVC design one is able to "reduce the overall design size while still preserving the ability to estimate highly informative model" (Vining, 2020). The design was created using design expert. The mixture components were A: butter, B: Gr Sugar, C: Br Sugar, and D: Vanilla. These terms were considered easy to change. The process factors for the design were Time and Temperature and considered hard to change. The build of the design included a total of 30 runs, 2 blocks (Saturday and Sunday), and 11 groups. The design is shown in Table 4 below.

| Block | Group | Run | Component 1 A:Butter grams | Component 2 <br> B:GrSugar grams | Component 3 C:BrSugar grams | Component 4 D:Vanilla grams | Factor 5 e:Temp | Factor 6 f:Time |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Saturday | 1 | 1 | 20.3333 | 16.6667 | 27 | 0 | 325 | 18 |
| Saturday | 1 | 2 | 25 | 24 | 15 | 0 | 325 | 18 |

Table 4: Design Expert Output for KVC Design

## Performing the Experiment and Analyzing the Data

## Performing the Experiment

## Recipe:

The base recipe used for the experiment was The Original Nestle Toll House Chocolate Chip Cookies found on the bag of Chocolate Chips. Omitted from the recipe was the salt and chopped nuts.

```
Ingredients
- 21/4 cups all-purpose flour
- }1\mathrm{ teaspoon baking soda
- 1 teaspoon salt
- 1 cup (2 sticks) butter, softened
- 3/4 cup granulated sugar
- 3/4 cup packed brown sugar
- }1\mathrm{ teaspoon vanilla extract
- 2 large eggs
- 2 cups (12-oz. pkg.) Nestlé Toll House Semi-Sweet Chocolate
Morsels
```

Figure 1: Original Nestle Toll House Chocolate Chip Cookie Recipe

## Test Runs:

A couple test runs were completed the weekend before the runs for the design experiment. The first was to run The Original Nestle Toll House Chocolate Chip Cookies found on the bag of Chocolate Chips with the all the ingredients as listed. This provided a baseline for taste testing. The cookies were baked at different times and temperature. This was done to make sure the time and temperature factors would not result in burnt or under cooked cookies.

Next test was to run a few different trial runs to test the range of low and high values of the different factors to make sure there were no concerns with the range. These do not meet the mixture design qualifications of the total ingredients equal the same amount. The batch sizes did allow to make at least 4 cookies each. These runs also allowed to determine the best way to mix the ingredients before running the full experiment.

## Baking Material \& Ingredients:

Ingredients were purchased in bulk to ensure all cookies are made from the same materials. All ingredients were mixed in the same ceramic bowl. Each of the ingredients were placed in the bowl and mixed together. The dough was mixed by hand due the batch size and to make sure the ingredients were mixed together.

To be able to make the batch size of 4 cookies the ingredients were weighed on a kitchen scale. In the table below are the cooking ingredients that were held constant in the experiment to produce 4 cookies per batch.

## Constant Factors

| Ingredients | 4 Cookie Batch (Grams) |
| :--- | ---: |
| Flour | 35 |
| Baking Soda | 0.7 |

| Eggs | 13 |
| :--- | :--- |
| Chocolate Chips | 36 |

Table 5: Constant Factors
Allowed-to-vary Factors and their ranges in grams for 4 cookie batch size

| Factor | Low | Center | High |
| :--- | ---: | ---: | ---: |
| Butter | 17 | 25 | 33 |
| Granulated Sugar | 13 | 18 | 24 |
| Brown sugar | 14 | 20 | 26 |
| Vanilla | 0 | .5 | 1 |
| Temperature (F Degrees) | 325 | 350 | 375 |
| Time (mins) | 12 | 15 | 18 |

Table 6: Factor Range

## Cooking Process:

After each batch was made the cookies were rolled into the same size cookie ball. Each cookie ball was weighed at 25 grams. This made sure the cookies were approximately the same size and weight prior to cooking to reduce nuisance factor of the size of the cookie.

Each of the batch sizes actually ended up resulting in a total of 5 cookies. 4 cookies were cooked together. The $5^{\text {th }}$ cookie was actually cooked separately. This cookie was used for the penny test and density test.

The cookies were made on a non-stick cookie sheet, along with parchment paper. The cookies were placed 1-2 in apart on the cookie sheet. 3 batches of cookies could be made at the same time to reduce the overall cooking time for the experiment. The 3 batches would have the same temperature and cooking time. The parchment paper was labeled with the cookie batch. There are some sample pictures found in the appendix.

The cookie sheet was placed on the second shelf in the oven. Cooking time was measured with a timer on my phone. Once the cookies were finished cooking the parchment paper with the cookies were removed from the cookie sheet and placed onto a cooling rack. The cookies cooled for at least 20-30 mins.

## Measuring Variables:

At that time the cookies had been cooled to room temperature each one was measured for length and height; an example is found in the appendix. Each cookie was measured with a tape measure. The weight of the cooked cookie was measured using a kitchen scale in grams. This was the same scale used to measure the cookie before placing in the oven. Once the measurements were performed the cookie was placed in individual bags labeled with a number and letter. These numbers and letters corresponded back to the batch.

The cookies were randomly placed in another set of bags to be used for the taste testing. Each person received a variety of cookies to measure the taste, appearance, and softness. Each person filled out a form rating the appearance, softness and taste. There was a total of 4 cookies in each batch that was part of the survey. Some people received more than one cookie in some of the batches. The directions were verbally explained to each person participating in the taste testing. Each person had 4 days to complete the form and return it. An example of the form can be found in the below Table 7.

| Batch (Letter \& | Taste (1-9) | Appearance (1-5) | Softness (1-5) |
| :--- | :--- | :--- | :--- |
| Number) | 1: Low - 9: High | 1: Low - 5: High | 1: soft - 5: crispy |
| Example: AAA 3 | 1 | 5 | 2 |
|  |  |  |  |

Table 7: Survey Form Example
The next day the density of the cookie was calculated on the $5^{\text {th }}$ cookie in the batch. The cookie was placed in zip lock bag with the air removed. Then the bag was placed in a copy of water. The bag was pushed down to the bottom with a paperclip as seen in Figure 2. The delta of the water displacement was recorded. Density was calculated by dividing the mass (grams) by volume (milliliters).

Figure 2: Density measurement
The penny test was also completed on the $5^{\text {th }}$ cookie after the density test was completed. It involved placing the cooked cookie, at room temperature on a cardboard box. On the box a line was drawn two inches from the edge. Each cookie was aligned to the line for the test. The cookie was placed facedown to allow the flat side of the cookie to be faced up to make it easier to place the pennies on the cookie. Each cookie was held with 2 fingers to keep it stable and hold it on the box. Pennies were individually added to the cookie until it started to bend as seen if Figure 3. If the cookie did not bend after 30 cookies, the cookie was given a value of 40 . If a cookie started to bend prior to pennies being placed on it, received a score of 0 .

Figure 3: Penny Test
All the data for the different variables were compiled into a excel spreadsheet.

## Statistical Analysis of the Data

## Data in Model and Actual Results:

The cookies were produced according to the batches presented earlier. For the responses, the average of the 4 different cookies in each batch was used.

Table show the results from the ANOVA for the Softness \& Penny Test showed significance in the subplot. The other responses showed not significant. This is the data before any adjustments were made to the model. In the appendix is the detailed figures showing the results from the ANOVA fixed response for the Softness and Penny Test

| Response | Significant <br> Variables | F-Value of <br> subplot | P-Value of <br> subplot | $R^{2}$ | Adjusted $R^{2}$ |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Softness | $\mathrm{A}, \mathrm{Be}$ | 6.85 | 0.0046 | 0.93 | 0.65 |
| Penny Test | $\mathrm{Ae}, \mathrm{BC}, \mathrm{e}^{2}$ | 8.25 | 0.0014 | 0.94 | 0.72 |

Table 8: Summary of ANOVA for Softness \& Penny Test
Below you will find the results of the Normal Plot of Residuals as is before any adjustments were made to the outliers for each of the variables. As you can tell in each of the graphs below there are some outliers except length.

Figure 4: Taste

Figure 5: Appearance

Figure 6: Softness

Figure 7: Weight

Figure 10: Density

## Adjusted Model \& Results:

After reviewing the data some adjustments were made to the responses:

- Reviewed the responses for the different batch sets in the excel file. If there was an outlier that could cause the average to be skewed. For example, on taste results showed $9,7,9,3$, removed the 3 from the average.
- Added 4 additional center points to the model. The model only had one center point on Saturday. Added 2 additional center points to Saturday and 2 center points to Sunday at different time and temperatures.
- Reviewed the Normal Plot of Residuals to see if any points did not meet the fat pencil test. Decided to ignore 3 points in total, 1 for taste, 2 for softness. Analysis was completed again after the changes. The results show significant subplots for Taste, Softness, Length and Penny Test. Still unsignificant for the other responses. In the Table you will see the Fixed Effects for the four responses. In the appendix are the more detailed results for these four responses.

Length response is significant but looking at the results from the table it not as significant as the responses as softness and penny test. Both the softness and penny test results improved after the adjustments.

| Response | Significant Variables | F-Value of <br> subplot | P-value of <br> subplot | $R^{2}$ | Adjusted $R^{2}$ |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Taste | A, Be | 4.28 | 0.0071 | 0.87 | 0.55 |
| Softness | A, B, D, AD, BD, CD, Ce, Df | 7.94 | 0.0006 | 0.93 | 0.73 |
| Length | A, B, C, Bf | 5.08 | 0.0304 | 0.87 | 0.59 |
| Penny Test | Ae | 3.86 | 0.0088 | 0.83 | 046 |

Table 9: Summary of ANOVA
Another thing to examine is the model graphs, below are the model graphs for the Taste, Softness and Penny Test.

Figure 11: Model Graphs: Taste, Softness \& Penny Test

## Final Equation and Future Considerations

## Results \& Summary

From the experiment it has been determined some of the variables are not significant to the type of recipe like the density, appearance and weight of the cookie. The length of the cookie showed significance but due to the higher $p$-value compared to the other variables it could be ignored in future considerations.

The table below provides a summary of top solution for the different desirability results depending on how a person might like their cookies. The constraints for appearance, weight and density were set with a low importance. These three responses had little significance on the experiment. The table covers the desirable cookie, soft cookie and crispy cookie. For the soft cookie the goal is to minimize the softness: limits 0-3, and importance 5 stars and Penny Test: limits $0-15$, and importance 5 stars. For a crispy cookie the goal is to maximize the softness: limits 0-3 and penny test 15-40.

| Variables | Desirable Cookie | Soft Cookie | Crispy Cookie |
| :--- | :--- | :--- | :--- |
| Butter | Center | Center | Low |
| Gr Sugar | Low | Low | High |
| Br Sugar | High | High | Low |
| Vanilla | Low | Center | Low |
| Temp | Low | Low | High |

| Time | Low | Low | Center |
| :--- | :--- | :--- | :--- |

Table 10: Summary of Desirability Results

Figure 12: Desirability Result

Figure 13: Soft Cookie Results

Figure 14: Crispy Cookie Results

## Future Considerations

In future experiments some of the following things should be considered or changed to improve on the experiment.

- Change other ingredients, for example flour. Flour weighs more than sugar it could change the density of the cookie and affect the taste of the cookie.
- Different type of scale, use a scale that is more precise
- Density test use vacuum sealer to get all the air out of it
- Bake one cookie at a time, similar to cooking with an easy back oven
- Additional blocks
- Taste panel
- Use the same people to test all the cookies
- Have the taste panel taste the cookies like taste testing wine, take a bite and spit it out and cleans the palate between tastes
- Consider have equal number of people on the panel that like crispy or soft cookies to get a better idea
- Absorption test: how much milk (or water) does the cookie absorb when dunked
