ANOVA Diagnostics

6

The Statistical Tool - ANOVA

The statistical relationship between the factors and the responses is built using the statistical tool called analysis of variance (ANOVA).

ANOVA for selected factorial model

Response 1: Filtration Rate

| Source | Sum of Squares | df | Mean Square | F-value | p-value | |
|------------------|----------------|----|-------------|---------|----------|-------------|
| Model | 5535.81 | 5 | 1107.16 | 56.74 | < 0.0001 | significant |
| A-Temperature | 1870.56 | 1 | 1870.56 | 95.86 | < 0.0001 | |
| C-Concentration | 390.06 | 1 | 390.06 | 19.99 | 0.0012 | |
| D-Stir Rate | 855.56 | 1 | 855.56 | 43.85 | < 0.0001 | |
| AC | 1314.06 | 1 | 1314.06 | 67.34 | < 0.0001 | |
| AD | 1105.56 | 1 | 1105.56 | 56.66 | < 0.0001 | |
| Residual | 195.12 | 10 | 19.51 | | | |
| Cor Total | 5730.94 | 15 | | | | |

Question: are the p-values, and related R^2 values, correct statistically?

ANOVA Diagnostics

7

ANOVA Assumptions

ANOVA validity assumes that the model is correct, and the residuals:

- Are (nearly) independent
 - Have a mean = 0
 - Have a constant variance
 - Follow a “well-behaved” distribution (approx. normal)
- If the model is correct, then the residuals should look like a sample of random variables – no “signal” remaining.
- If the assumptions are violated, then the p-values, R-squared values, predictions, etc, are wrong.

ANOVA Diagnostics

8

Agenda

- Analyzing DOE results – why check diagnostics?
- **Diagnostic basics**
- Case Study – Well (bad diagnostics and a transformation)
- Wrap Up

ANOVA Diagnostics

9

What is a residual?

Residual – difference between the actual data and the predicted value. $e_i = y_i - \hat{y}_i$

Reasons **not** to use the raw residuals to verify ANOVA:

- Sensitive to under-fitting or over-fitting of the model (too few or too many terms)
- Variance is not constant

ANOVA Diagnostics

10

Better residuals

Internally studentized residuals (standardized) – the raw residual divided by its estimated standard error. This helps with nonconstant variance but does not follow a t distribution.

$$r_i = \frac{e_i}{\sqrt{MS_{res}(1 - h_{ii})}}$$

Externally studentized residuals (deleted) – adjusted to drop the i th data point. Corrects for nonconstant variance and follows a t distribution (which converges to the normal).

$$t_i = \frac{e_i}{\sqrt{MS_{res(-i)}(1 - h_{ii})}}$$

**BEST for
verifying
assumptions**

ANOVA Diagnostics

11

Diagnostic plots of Externally Std. Residuals

Normal plot of residuals – look for large violations of normality

Residuals vs Predicted – look for non-constant variance across range

Residuals vs Run – check for time-based trends or patterns

ANOVA Diagnostics

12

Agenda

- Analyzing DOE results – why check diagnostics?
- Diagnostic basics
- **Case Study – Well (bad diagnostics and a transformation)**
- Wrap Up

ANOVA Diagnostics

13

Well-Drilling Experiment 2⁴ factorial – Background

This is a case study with a twist (pun-intended). The goal is to increase the advance rate of a drilling operation.

The drill is driven by a pipe, which carries a water-based mud down-hole to:

- Carry off the pulverized rock and
- Lubricate the drill-bit.

The mud carries the bits of rock up the annulus of the borehole. It then runs through gratings to shed off the rock-cuttings before being re-circulated.

ANOVA Diagnostics

14

Well-Drilling Experiment

Input factors and ranges to study:

| Factor | Units | Low Level (-) | High Level (+) |
|--------|----------|---------------|----------------|
| Load | tons | 50 | 70 |
| Flow | gal/min | 180 | 220 |
| Speed | 1/sec | 45000 | 55000 |
| Mud | base gum | guar | xanthan |

Open Well and analyze.

ANOVA Diagnostics

15

Well-Drilling Experiment

Fit a model and view ANOVA and Fit Statistics:

| Source | Sum of Squares | df | Mean Square | F-value | p-value | |
|------------------|----------------|----|-------------|---------|----------|-------------|
| Model | 216.00 | 5 | 43.20 | 48.93 | < 0.0001 | significant |
| B-Flow | 40.80 | 1 | 40.80 | 46.21 | < 0.0001 | |
| C-Speed | 142.50 | 1 | 142.50 | 161.42 | < 0.0001 | |
| D-Mud | 17.00 | 1 | 17.00 | 19.25 | 0.0014 | |
| BC | 8.48 | 1 | 8.48 | 9.61 | 0.0113 | |
| CD | 7.22 | 1 | 7.22 | 8.18 | 0.0169 | |
| Residual | 8.83 | 10 | 0.8828 | | | |
| Cor Total | 224.83 | 15 | | | | |

| | | | | |
|------------------|--------|--|--------------------------------|---------|
| Std. Dev. | 0.9396 | | R² | 0.9607 |
| Mean | 5.92 | | Adjusted R² | 0.9411 |
| C.V. % | 15.86 | | Predicted R² | 0.8995 |
| | | | Adeq Precision | 19.5066 |

All looks good here!
Check diagnostics →

ANOVA Diagnostics

16

Normal plot of residuals – what it should be

The residuals should follow a well-behaved distribution.

- Single peak
- Roughly symmetric
- Tails die rapidly

Roughly a normal distribution.

ANOVA is robust to moderate deviations from normality, so no need for a formal test (like Shapiro Wilks).

ANOVA Diagnostics

17

Well-Drilling Experiment Diagnostic plots

Normal probability plot of residuals: want approximate normality

The residuals are not approximately normally distributed. This shows an S-shaped curve.

ANOVA Diagnostics

18

Residuals vs Predicted – what it should be

The plot should be a random scatter of points.

Look for systematic patterns or evidence of increasing variability as the predicted value increases.

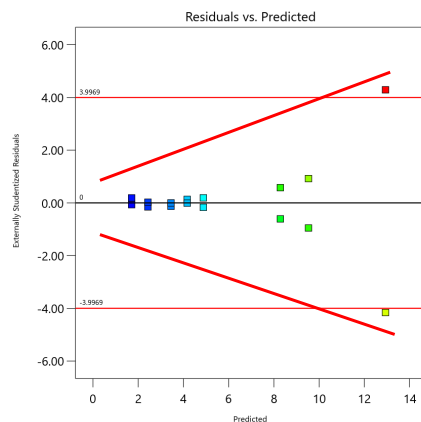

ANOVA Diagnostics

19

Well-Drilling Experiment Diagnostic plots

Predicted vs Residuals: Look for constant variance left to right.

The residuals have small variation with small predictions and increasing variation with larger predictions.

ANOVA Diagnostics

20

Residuals vs Run Order – what it should be

This time-ordered plot should show no patterns or trends.

- Watch for upward or downward trends, clumps of data.
- Watch for points not predicted well by the model, usually called “outliers”.

ANOVA Diagnostics

21

Well-Drilling Experiment Diagnostic plots

Residuals vs Run: want no time-based patterns/trends, no outliers

There are no particular trends, but there are 2 points that are not fit well by this model. “Outliers”??

ANOVA Diagnostics

22

Box Cox plot – what it should be

Current transform: None
Current Lambda = 1
Recommended transform: None

This plot will either recommend NO transformation or specify a particular legend.

ANOVA Diagnostics

23

Well-Drilling Experiment Box-Cox plot for transformations

Response: Advance
Current transform: None
Current Lambda = 1
Recommended transform: Log
(Lambda = 0)

The recommended transformation is a Log, so re-analyze the data using this scale.

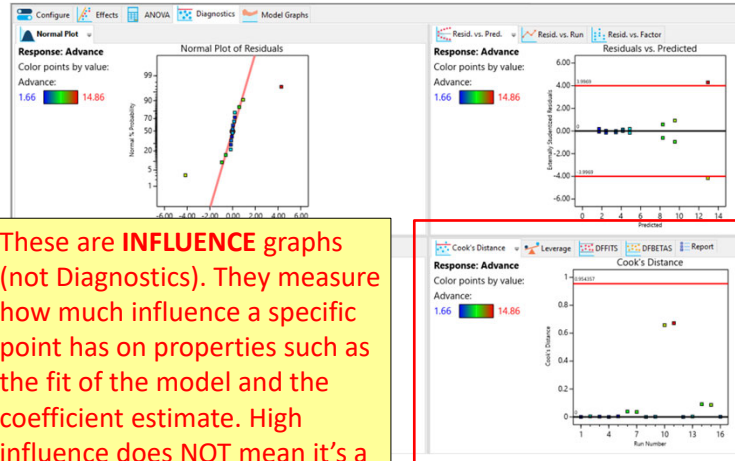

ANOVA Diagnostics

24

Well-Drilling Experiment

What about the lower right graphs?

ANOVA Diagnostics

25

Well-Drilling Experiment

Re-analyze with log transform

| | Source | Sum of Squares | df | Mean Square | F-value | p-value | |
|--|------------------|----------------|----|-------------|---------|----------|-------------|
| | Model | 1.26 | 3 | 0.4191 | 206.68 | < 0.0001 | significant |
| | B-Flow | 0.2568 | 1 | 0.2568 | 126.65 | < 0.0001 | |
| | C-Speed | 0.9155 | 1 | 0.9155 | 451.51 | < 0.0001 | |
| | D-Mud | 0.0849 | 1 | 0.0849 | 41.87 | < 0.0001 | |
| | Residual | 0.0243 | 12 | 0.0020 | | | |
| | Cor Total | 1.28 | 15 | | | | |

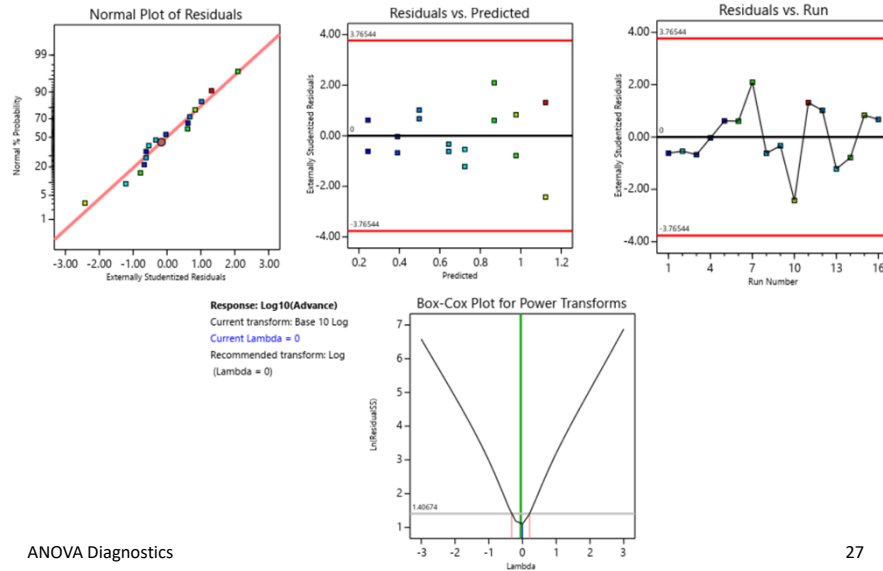

| | Std. Dev. | 0.0450 | R² | 0.9810 |
|--|------------------|--------|--------------------------------|---------|
| | Mean | 0.6835 | Adjusted R² | 0.9763 |
| | C.V. % | 6.59 | Predicted R² | 0.9662 |
| | | | Adeq Precision | 38.9736 |

Fewer terms in the model, but it predicts better, explaining more variation.

ANOVA Diagnostics

26

Well-Drilling Experiment Diagnostics after log transform

27

Agenda

- Analyzing DOE results – why check diagnostics?
- Diagnostic basics
- Case Study – Well (bad diagnostics and a transformation)
- **Wrap Up**

ANOVA Diagnostics

28

Why check diagnostics? Satisfy ANOVA Assumptions

ANOVA validity assumes that the model is correct,
and the residuals:

- Are (nearly) independent (Resid vs Run Order)
- Have a mean = 0 (given by math)
- Have a constant variance (Resid vs Predicted)
- Follow a “well-behaved” distribution (Normal probability plot)

➤ If the model is correct, then the residuals should look like a sample of random variables – no “signal” remaining.

ANOVA Diagnostics

29

What if the residuals remain messy?

- Check the science – could there be any additional variables to consider?
- This is a small sample – did you have some “bad luck” and it just happens to have some unknown random effects?
- Do confirmation runs – use the model as is (even if a bit messy), pick some plausible/desirable conditions, and run them.
Compare results to the predicted values from Point Prediction.
- Do a replicate or collect more data to enhance the information.

The researcher must weigh the risks of using an imperfect model versus spending more money to get more data.
